Paderborn, 14.07.2020

## PROBLEM 1

### 1-1- The codes of the problem 1 contain 6 errors

| <i>Errors</i>  | <i>Corrections</i>                                |
|--|---|
| <b>Error 1:</b><br><code>p = sample(1:6, <u>n = 1</u>)</code>        | <code>p = sample(1:6, <u>size= 1</u>)</code>      |
| <b>Error 2:</b><br><code>q = sample(1:6, <u>n = 1</u>)</code>        | <code>q = sample(1:6, <u>size= 1</u>)</code>      |
| <b>Error 3:</b><br><code>err[(t - 1):(<u>p - q</u>)]</code>          | <code>err[(t - 1):(<u>t - q</u>)]</code>          |
| <b>Error 4:</b><br><code>err[(t - 1):(p - q)] + <u>Err[t]</u></code> | <code>err[(t - 1):(p - q)] + <u>err[t]</u></code> |
| <b>Error 5:</b><br><code>Y = y[(n + <u>1</u>)(<u>2</u>*n)]</code>    | <code>Y = y[(n + <u>1</u>)*(<u>2</u>*n)]</code>   |
| <b>Error 6:</b><br><code>Y = y[(n + 1)(2*n)<u>]</u></code>           | <code>Y = y[(n + 1)(2*n)<u>]</u></code>           |

### Error's description

**Error 1 and 2:** Because we first defined “n” as the number of observations, we cannot use it as the size of our sample. Due, to correct the error we have used we have used size instead “n”.

**Error 3 and 4:** on this line code the first error concern MA(q) process: *alpha %\*\*% err[(t - 1):(p - q)]* which normally is normally is defined as *alpha %\*\*% err[(t - 1):(p - q)]*.

Concerning the second error *Err[t]*, we should used *err[t]* because we first defined it

### Error 5 and 6:

$$Y = y[(n + 1)(2*n)]$$

Here we add the sign of multiplication because R does not recognize parenthesis as multiplication, and we also changed “]” *whit* “)”.

### 1-2- The formula of the ARMA process taken form the code

ARMA=arima.sim(n=n, list(ar=c(0.225, 0.211), ma=c(0.064, 0.151, 0.055, 0.052, 0.158, 0.039))

ARMA(2,0,6):

$$X_t = 0.225X_{t-1} + 0.211X_{t-2} + 0.064\epsilon_{t-1} + 0.151\epsilon_{t-2} + 0.055\epsilon_{t-3} + 0.052\epsilon_{t-4} + 0.158\epsilon_{t-5} + 0.039\epsilon_{t-6} + \epsilon_t$$

### 1-3- Plot of the autocorrelation function of the time-series for 10 and 50 lags

- For lag.max = 10: The acf at 5% indicates a significant dependence but it is not strong.
- For lag.max = 50: the acf at 5% indicates a significant dependence but it is not strong.

### 1- 4- Fit 16 AR(p) models for p= 0,...,15 and find the best models according to the AIC and BIC

- The best models according to AIC is: **AR(2)**

To find this best model we compared all the models according to the AIC, then we chose the third model (with p = 0, ..., 15) that has the smallest AIC. Considering that the first model corresponds to p = 0, thus the third model corresponds to p = 2.

| P=0      | P=1      | P=2             | P=3      | P=4      | P=5      | P=6      | P=7      |
|----------|----------|-----------------|----------|----------|----------|----------|----------|
| 1482.263 | 1438.437 | <b>1399.724</b> | 1401.401 | 1402.799 | 1403.906 | 1405.167 | 1406.117 |
| P=8      | P=9      | P=10            | P=11     | P=12     | P=13     | P=14     | P=15     |
| 1407.807 | 1406.857 | 1408.853        | 1410.785 | 1412.207 | 1413.625 | 1415.154 | 1417.013 |

Thus, the Best-Model is

| arima(x = AR, order = c(2, 0, 0))                                    |        |        |           |
|--|--------|--------|-----------|
| Coefficients   | ar1    | ar2    | Intercept |
|  | 0.2127 | 0.2799 | 0.0125    |
| s.e.   | 0.0429 | 0.0429 | 0.0855    |
| sigma^2 estimated as 0.9465: log likelihood = -695.86, aic = 1399.72 |        |        |           |

$$Y_t = X_t - 0.0125$$

$$X_t = 0.2127X_{t-1} + 0.2799X_{t-2} + \varepsilon_t$$

$$V(\varepsilon_t) = 0.9465$$

- The best models according to BIC is: **AR(2)**

To find this best model we compared all the models according to the BIC, then we chose the third model (with p = 0, ..., 15) that has the smallest BIC. Considering that the first model corresponds to p = 0, thus the third model corresponds to p = 2.

| P=0      | P=1      | P=2      | P=3      | P=4      | P=5      | P=6      | P=7      |
|----------|----------|----------|----------|----------|----------|----------|----------|
| 1478.263 | 1438.652 | 1404.153 | 1410.045 | 1415.657 | 1420.979 | 1426.454 | 1431.619 |
| P=8      | P=9      | P=10     | P=11     | P=12     | P=13     | P=14     | P=15     |
| 1437.524 | 1440.789 | 1447.000 | 1453.146 | 1458.783 | 1464.415 | 1470.159 | 1476.232 |

Thus, the Best-Model is

| arima(x = AR, order = c(2, 0, 0))                                    |        |        |           |
|--|--------|--------|-----------|
| Coefficients   | ar1    | ar2    | Intercept |
|  | 0.2127 | 0.2799 | 0.0125    |
| s.e.   | 0.0429 | 0.0429 | 0.0855    |
| sigma^2 estimated as 0.9465: log likelihood = -695.86, aic = 1399.72 |        |        |           |

$$Y_t = X_t - 0.0125$$

$$X_t = 0.2127X_{t-1} + 0.2799X_{t-2} + \varepsilon_t$$

$$V(\varepsilon_t) = 0.9465$$

#### 1- 5- Fit 36 ARMA (p, q) models for p= 0,...,5 and q= 0,...,5

- Best ARMA models according to AIC is: **ARMA(2, 0, 5)**

Considering that p = 0, ... 5, and q = 0, ... 5, we have the taken the intersection of the smallest AIC between P and q.

| q \ p | 0        | 1        | 2        | 3        | 4        | 5        |
|-------|----------|----------|----------|----------|----------|----------|
| 0     | 1612.657 | 1519.352 | 1456.725 | 1439.894 | 1439.800 | 1423.434 |
| 1     | 1453.460 | 1415.036 | 1413.972 | 1415.557 | 1414.801 | 1402.567 |
| 2     | 1413.394 | 1413.553 | 1415.488 | 1417.340 | 1417.818 | 1402.148 |
| 3     | 1413.812 | 1415.471 | 1414.989 | 1416.593 | 1412.810 | 1402.570 |
| 4     | 1415.737 | 1417.430 | 1416.767 | 1414.446 | 1411.179 | 1404.570 |
| 5     | 1413.174 | 1412.311 | 1414.247 | 1406.802 | 1405.464 | 1406.409 |

Thus, the Best-Model is

| arima(x = ARMA, order = c(2, 0, 5))                                  |        |         |         |        |         |        |        |           |
|--|--------|---------|---------|--------|---------|--------|--------|-----------|
| Coefficients   | ar1    | ar2     | ma1     | ma2    | ma3     | ma4    | ma5    | intercept |
|  | 1.0591 | -0.3438 | -0.7190 | 0.3532 | -0.0052 | 0.0586 | 0.1783 | 0.0781    |
| s.e.   | 0.2390 | 0.1906  | 0.2383  | 0.1297 | 0.0720  | 0.0634 | 0.0654 | 0.1306    |
| sigma^2 estimated as 0.9313: log likelihood = -692.07, aic = 1402.15 |        |         |         |        |         |        |        |           |

$$Y_t = X_t - 0.0781$$

$$X_t = 1.0591X_{t-1} - 0.3438X_{t-2} - 0.7190\varepsilon_{t-1} + 0.3532\varepsilon_{t-2} - 0.0052\varepsilon_{t-3} + 0.0586\varepsilon_{t-4} + 0.1783\varepsilon_{t-5} + \varepsilon_t$$

$$V(\varepsilon_t) = 0.9313$$

- The best model according to BIC is: **ARMA(2, 0, 0)**

Considering that  $p = 0, \dots, 5$ , and  $q = 0, \dots, 5$ , we have taken the intersection of the smallest BIC between  $P$  and  $q$ .

| p \ q | 0               | 1        | 2        | 3        | 4        | 5        |
|-------|-----------------|----------|----------|----------|----------|----------|
| 0     | 1608.657        | 1519.567 | 1461.154 | 1448.537 | 1452.659 | 1440.507 |
| 1     | 1453.675        | 1419.465 | 1422.615 | 1428.415 | 1431.874 | 1423.855 |
| 2     | <b>1417.823</b> | 1422.197 | 1428.347 | 1434.413 | 1439.105 | 1427.651 |
| 3     | 1422.456        | 1428.330 | 1432.062 | 1437.881 | 1438.313 | 1432.287 |
| 4     | 1428.595        | 1434.503 | 1438.055 | 1439.948 | 1440.896 | 1438.501 |
| 5     | 1430.247        | 1433.599 | 1439.749 | 1436.519 | 1439.396 | 1444.555 |

On the matrices of the AIC and BIC above, the first line and column correspond to the order (0, 0, 0).

Thus, the Best-Model is

| arima(x = ARMA, order = c(2, 0, 0))                                 |        |        |           |
|---|--------|--------|-----------|
|   | ar1    | ar2    | Intercept |
| Coefficients  | 0.3760 | 0.2839 | 0.0795    |
| s.e.  | 0.0428 | 0.0428 | 0.1290    |
| sigma^2 estimated as 0.9723: log likelihood = -702.7, aic = 1413.39 |        |        |           |

$$Y_t = X_t - 0.0795$$

$$X_t = 0.3760X_{t-1} + 0.2839X_{t-2} + \varepsilon_t$$

$$V(\varepsilon_t) = 0.9723$$

## **PROBLEM 2**

### **2-1- Explanation of the choice of data**

The data we have used are that of Apple and an Insurance company was taken from Yahoo Finance.

#### **❖ APPLE**

We chose Apple Inc. because it is the world richest electronic company. This company not only marketed his range of the products within his mere territories but has supplied all over the word and has earned his name at the first place of the top ten list of the richest electronic companies. However, during the crisis of 2008 Apple had set revenue record, and according

to the article “Computerworld united States”, that says I quote: “Apple had set in a single-quarter revenue record in the last three month of 2008, selling more than 2.5 million Macs and 4.3 million iPhones. It sold 1.8 million notebooks and 728,000 desktops in the first fiscal quarter, which ended Dec. 31, 2008 and increase of the former, but a drop of 25% for latter over the same quarter....” (see more by clicking on the link of the article). Overall Apple was also affected by the crisis but had been able to maintain strong products sales even in the face of a generally lousy economy.

### ❖ **PBCT (People’s United Financial Inc)**

It is an American bank holding company that owns People’s United Bank whit \$36 billion in assets, which boasts more than 400 traditional branches, supermarket branches, commercial banking offices... In addition to retail and commercial banking services, the bank offers trust, wealth management, brokerage, and insurance services. Its lending activities consist mainly of commercial and industrial loans, and commercial mortgages, residential mortgages, equipment financing, and home equity loans. Concerning the crisis, the People’s United Financial Inc has been considerably raising its dividend payment for the last teen years and seemed to be low and slow-moving and never had a dividend cut even during the financial crisis. But People’s United Financials’ results were subject to fluctuations based on the crisis. In fact, the second half of 2007 has been highlighted by significant disruption and volatility. This turbulence has been attributable to variety of factors, including the fallout associated with the sub-prime mortgage market, and one aspect of this fallout has been significant deterioration in the activity of the secondary residential mortgage market. The disruptions have been exacerbated by the acceleration of the decline of the real estate and housing market.

## 2-2- Plot of Apple’s and PBCT’s Closes

**The APPLE and PBCT Index from 2005 to 2018**

### **Plot of Apple’s and PBCT’s returns**

**The Return Series of Apple**

**The Return Series of the PBCT**

As we can see on the graphs both time series are not stationary, but their returns are stationary.

### 2-3- Fit the GARCH model for Apple

| Error Analysis: |           |            |         |              |
|-----------------|-----------|------------|---------|--------------|
|                 | Estimate  | Std. Error | t value | Pr(> t )     |
| mu              | 1.695e-03 | 2.850e-04  | 5.947   | 2.73e-09 *** |
| omega           | 9.597e-06 | 2.079e-06  | 4.615   | 3.93e-06 *** |
| alpha1          | 8.177e-02 | 1.274e-02  | 6.417   | 1.39e-10 *** |
| beta1           | 8.961e-01 | 1.578e-02  | 56.784  | < 2e-16 ***  |

**AIC**  
**-5.133035**

**BIC**  
**-5.126030**

A general GARCH(1,1) Model is given by

$$Y_t - \mu | \mathcal{F}_t \sim \mathcal{N}(0, h_t) h_t = \alpha_0 + \alpha_1 Y_{t-1}^2 + \beta_1 h_{t-1}$$

Here:  $Y_t - 1.695 \cdot 10^{-3} | \mathcal{F}_t \sim \mathcal{N}(0, h_t) h_t = 9.597 \cdot 10^{-6} + 8.177 \cdot 10^{-2} Y_{t-1}^2 + 0.8961 h_{t-1}$

- Fit the GARCH model for PBCT**

| Error Analysis: |           |            |         |              |
|-----------------|-----------|------------|---------|--------------|
|                 | Estimate  | Std. Error | t value | Pr(> t )     |
| mu              | 2.747e-04 | 1.977e-04  | 1.390   | 0.164667     |
| omega           | 6.522e-06 | 1.731e-06  | 3.768   | 0.000165 *** |
| alpha1          | 9.829e-02 | 1.654e-02  | 5.944   | 2.78e-09 *** |
| beta1           | 8.711e-01 | 2.317e-02  | 37.590  | < 2e-16 ***  |

**AIC**  
**-5.823389**

**BIC**  
**-5.816384**

$$Y_t - \mu | \mathcal{F}_t \sim \mathcal{N}(0, h_t) h_t = \alpha_0 + \alpha_1 Y_{t-1}^2 + \beta_1 h_{t-1}$$

$Y_t - 2.747 \cdot 10^{-4} | \mathcal{F}_t \sim \mathcal{N}(0, h_t) h_t = 6.522 \cdot 10^{-6} + 9.829 \cdot 10^{-2} Y_{t-1}^2 + 0.8711 h_{t-1}$

### Plot of the Volatility along with the Return

## 2-4- Divide both return-series in a part before, during and after the financial crisis

- The period before the financial crisis: 01.2005-12.2007
- During the financial crisis: 01.2008-06.2009
- After the financial crisis: 07.2009-12.2018

From 2005 to the end of 2007 (before the financial crisis) and from July of 2009 to December 2018 (after the financial crisis) yields do not differ too much (stationary). From 2008 to Jun 2009 (during the crisis), yields diverge very considerably (non-stationary).

### Plot of the volatility

## 2-5 - Calculate de the correlation between the return-series of the firms for all three parts from

|  | Part before the crisis | Part during the crisis | Part after the crisis |
|--|------------------------|------------------------|-----------------------|
| <b>Correlation between the Return times-series of AAPL and PBCT</b>  | 0.2242927              | 0.4292943              | NA                    |
| <b>Correlation between The estimated volatility of AAPL and PBCT</b> | 0.3181464              | 0.8344395              | NA                    |

### ❖ ***Consequences of the crisis on the financial Sector***

In the year of the depression (2008), many banks and financial firms around the globe were affected by the financial crisis, which started from housing market in the US before spread into financial markets. The housing bubble in the US grew up the stock bubble in the mid-90s and the increasing in stock prices made unexpected wealth for people and they started to spend this extra money. This led to the consumption boom of the late 90s, with saving rate out of disposable income falling from close 5% in the middle of the decade to 2% by 2000 [1]. This extra money encourages people to buy better and bigger homes. It results in exceeding demand triggered housing bubble than the supply and it led an increasing price. After that, the signs of financial crisis appear by housing bubble burst and drastic decline in house prices which were started in 2007 and become prominently in September 2008. Outcomes of the crisis are not just limited to financial and housing markets. Its consequences have spread around the world and affected almost all aspects of people's lives (increasing unemployment rate). The crisis has both inflationary and deflationary effects in the world and people have less credit to finance their purchases so by diminishing trades and decrease in demand, prices come down (deflation). On the other hand, to repel the crisis some governments inject money into society. Sometimes this decision has inflationary results as it caused increasing inflation rate in some countries [2].

### ❖ ***Consequences of the crisis on the Goods and Services Markets***

According to the Author Jahan Zeb and his book called: "Impact of Current Financial Crisis on Banking Sector, Munich GRIN Verlag", who talks about the consequences of the financial crisis on the goods and services Market, I quote: *"The banking crisis effected almost all sector of the economy especially production sectors. Their effects on the other areas, for example, rising unemployment or cut down the working hours, Consumer spending has fallen, reflecting heightened uncertainty, tight credit conditions and lower financial wealth. Business and dwellings investment have also declined, and near-term indicators point to further falls. The slowdown in activity has been significantly amplified by companies running down stocks. In addition to the downturn in demand for highly traded manufactured goods especially autos industry, and the falls in trade flows resulting from the disruption of globalized supply chains, a reduction in the supply of credit used to facilitate international trade may also have exacerbated the decline in trade flows. One more factor underlying the collapse in world trade flows is that, during the current downturn, the more trade-intensive elements of demand have been most affected. For example, demand for items such as capital goods, motor vehicles and other consumer durables appears to have fallen"*.

We can conclude that the crisis has had major negative impacts both on financial markets and on the goods and services markets.

### PROBLEM 3

1-3 - For the problem 3 we have work with the Amazon Date from 12.06.2017 to 12.06.2020. Display the time-series and its log-return series in a suitable graph.

**The Amazon Index and Return,from 12.jun.2017 to 12 jun 2020**

3-2- Fit 4 GARCH(p,q) models for p; q = 1; 2 to the log-returns of this sub-series under a conditional normal distribution.

- **AMZN\_1.GARCH11**

| <i>Coefficient(s):</i>                   | mu         | omega      | alpha1     | beta1        |
|--|------------|------------|------------|--------------|

### BIC values for the Models

| p \ q | 1         | 2         |
|-------|-----------|-----------|
|       | 1         | 2         |
| 1     | -5.161501 | -5.152469 |
| 2     | -5.148929 | -5.140163 |

Considering that  $p = 1, \dots, 2$ , and  $q = 1, \dots, 2$ , we have taken the intersection of the smallest BIC between  $P$  and  $q$ .

The best models is **AMZN\_1. GARCH11** which corresponds to **GARCH (1,1)**

### The GARCH Best Model.

| Coefficient(s):                          | mu         | omega      | alpha1     | beta1        |
|--|------------|------------|------------|--------------|
|  | 1.6431e-03 | 5.3134e-05 | 3.0990e-01 | 5.9914e-01   |
| <i>Std. Errors:<br/>based on Hessian</i> |            |            |            |              |
| Error Analysis:                          | Estimate   | Std. Error | t value    | Pr(> t )     |
| mu                                       | 1.643e-03  | 7.166e-04  | 2.293      | 0.021850 *   |
| omega                                    | 5.313e-05  | 1.764e-05  | 3.013      | 0.002589 **  |
| alpha1                                   | 3.099e-01  | 8.043e-02  | 3.853      | 0.000117 *** |
| beta1                                    | 5.991e-01  | 8.014e-02  | 7.476      | 7.68e-14 *** |

A general GARCH(1,1) Model is given by

$$Y_t - \mu \setminus \mathcal{F}_t \sim \mathcal{N}(0, h_t) h_t = \alpha_0 + \alpha_1 Y_{t-1}^2 + \beta_1 h_{t-1}$$

Here

$$Y_t - 1.643 \cdot 10^{-3} \setminus \mathcal{F}_t \sim \mathcal{N}(0, h_t) h_t = 5.313 \cdot 10^{-5} + 0.3099 Y_{t-1}^2 + 0.5991 h_{t-1}$$

### 3.3- Prediction of the conditional volatility of year 3 of the time series by using your model from 3.2.

*The six first Values of the volatility's prediction (Volatility=Standard Deviation)*

| N° | Date       | meanForecast | meanError  | standardDeviation |
|----|------------|--------------|------------|-------------------|
| 1  | 2019-06-13 | 0.001643119  | 0.02324966 | 0.02324966        |
| 2  | 2019-06-14 | 0.001643119  | 0.02333477 | 0.02333477        |
| 3  | 2019-06-17 | 0.001643119  | 0.02341188 | 0.02341188        |
| 4  | 2019-06-18 | 0.001643119  | 0.02348175 | 0.02348175        |
| 5  | 2019-06-19 | 0.001643119  | 0.02354508 | 0.02354508        |
| 6  | 2019-06-20 | 0.001643119  | 0.02360251 | 0.02360251        |

*The six last Values of the volatility's prediction (Volatility=Standard Deviation)*

| N°  | Date       | meanForecast | meanError | standardDeviation |
|-----|------------|--------------|-----------|-------------------|
| 246 | 2020-06-04 | 0.001643119  | 0.0241689 | 0.0241689         |
| 247 | 2020-06-05 | 0.001643119  | 0.0241689 | 0.0241689         |
| 248 | 2020-06-08 | 0.001643119  | 0.0241689 | 0.0241689         |
